

ABSTRACT

A receiver and an electronic device are provided that suppress deterioration of the signal waveform of a symbol. The receiver has filter (12) that sends out an output signal having a symbol at an arbitrary time interval; and intermittent operation part (13) that
5 controls filter (12) intermittently at an arbitrary time interval, according to an output signal supplied from filter (12). The makeup prevents deterioration of the signal waveform of a symbol, by setting the timing for switching the signal for controlling the frequency
10 characteristic of filter (12), to an arbitrary period between symbol periods such as a guard interval.
